A QUALITY HOUSING ENVIRONMENT IS ONE THAT PROVIDES GOOD QUALITY HOUSING TO MEET IDENTIFIED NEEDS IN PLACES PEOPLE WANT TO LIVE
THIS HANDBOOK PROVIDES ARCHITECTS, PLANNERS, DEVELOPERS AND OTHER HOUSING PROFESSIONALS IN THE PRIVATE AND PUBLIC SECTOR WITH AN INTRODUCTION TO THE ELEMENTS THAT CONTRIBUTE TO THE DESIGN OF GOOD QUALITY APARTMENTS AND URBAN HOUSING
The purpose of this design guide is to provide architects, planners, developers and other housing professionals in the private and public sector with an overview of the elements that contribute to the design of good quality apartments and urban housing. By considering a range of layouts and typologies and by drawing on examples from around Europe the guide aims to demonstrate the potential of good design to make apartments the dwellings of choice.

Whereas, in Ireland, apartment living has traditionally been seen as a temporary solution to housing need, in many parts of Europe long term apartment living is the norm, and it is likely that this will increasingly be the case in this country. An ever-expanding suburbia is neither sustainable nor, given our changing demographics, necessarily desirable, for many. This guide looks at the ways in which the amenities that people might traditionally expect from sub-urban housing can be provided within apartment developments.

High quality, carefully considered design is essential if apartments are to provide people with the same quality of life that they would expect to obtain from traditional housing and the guide includes numerous examples of best practice design from Ireland and abroad.

Whereas the guidelines generally seek to demonstrate what is achievable within the context of the DHPLG Design Standards for New Apartments (March 2018), not all of the examples included in this document comply with current Irish regulatory standards.

These guidelines do not purport to provide guidance on compliance with statutory planning requirements or construction standards (such as Building Regulations and including fire safety and access requirements and other requirements).

Designers are advised that the context within which a specific development takes place may give rise to specific planning, regulatory (including fire) and other safety requirements during construction and when the building is substantially complete.

All design solutions need to consider the user groups for which the building is intended. Some of the proposals included in this guide may give rise to maintenance and other issues that make them unsuitable in certain situations.

All drawings copyright of Urban Agency, unless otherwise specified.

No liability whatsoever is accepted to any person or body arising out of any reliance on the contents of this document.

Acknowledgement

The Housing Agency and Urban Agency would like to thank the Department on Housing Community and Local Government and the many architects who provided advice and material - without their generous contributions it would not have been possible to produce this document. Thanks also to One House Communications for their very valuable work in designing and producing the final document.
This guide is divided into five sections:

01 BLOCK DESIGN
02 TYPOLOGIES
03 AMENITY SPACES
04 SHARED SPACES
05 PLACE MAKING AND STREETSCAPES

Chapter 1, block design, considers a non-exhaustive, range of block configurations that have been used around Europe and that could be used in this country. Illustrated examples with key data such as density, site coverage and numbers of units are provided for each block type. Block layouts, core design, access to dwellings and the design of entrance areas are also considered.

Chapter 2 of the guide provides examples of apartment and duplexes that comply with the DHPLG Design Standards for New Apartments (March 2018). Examples of both standard and of alternative design solutions, that allow for the omission of internal fire protected lobbies, are included.

Well-designed private amenity spaces can significantly enhance the experience of apartment living. Chapter 3 lists the elements that should be considered when designing balconies and winter gardens.

Auxiliary and community spaces, such as concierges, common rooms and shared areas help to create a sense of belonging and foster community. Chapter 4 provides examples of entrances, parking areas and open spaces that include successful shared amenity spaces.

A good quality public realm with attractive well designed spaces that can be enjoyed by all is an essential component of all good housing. Chapter 5 provides examples of successful place making that incorporates well designed hard and soft landscaping.

Every building design is unique and the examples provided will be applied in different ways by individual designers working to individual project briefs tailored to particular circumstances. It is hoped that this handbook will encourage all those who have an input into the design of apartments to ensure that the apartments of the future become great places to live.
This chapter deals with the different typologies of urban blocks. It considers different types of urban blocks in a catalogue that we see present around Europe and that could be used in Ireland.

B | TERRACED COURTYARD HOUSES

C | INFILL DEVELOPMENT

D | BLOCK TURNING A CORNER

**MEDIUM DENSITY**

E | STACKED HOUSE

F | BIG HOUSE

Timberyard Social Housing, Dublin, Ireland
Completed April 2009, Project Size 3800 m²
47 dwellings and a street level community room in the historic Liberties of Dublin.

This scheme repairs the local landscape by providing a new collective space, built around a former timber yard, making a residential enclave with a sense of place.

The scheme works between the six storey scale proposed in general along the new Cork Street corridor and the smaller scale of the existing houses behind the site. The new buildings are in brick, with hardwood windows and screens to terraces and roof gardens. The windows are offset from each other in the walls to work with the complexity of the residential accommodation within, and to emphasise the continuity of the brick surface. The walls are modulated with recessed porches and terraces and projecting bay windows to give a depth and complexity to the building's edge and an interface between the private world of the house and the neighbourhood.

The development proposes to provide scale, identity and a piece of living city, which connects new development in the area to the historic character of the Liberties.

Dublin is a city of rhythmic houses built of brick. Tall, gaunt and scuffing syncopations on the sidewalk and against the sky, the Timberyard looks like a child's drawing of the city. With its mysterious, deep openings, it is both familiar and strange, as the architect dreamt. It claims local allies, taking cues from an industrial brick tower across the road, and, on its eastern edge, giving shelter to a Marian grotto that previously stood outside the site. The Madonna is a surprise but she contributes graciously to the short pedestrian passage that is her new home. Locals have taken to placing a vase of cut flowers at her feet.

1.1 DENSITY | LOW DENSITY

A | TERRACED HOUSES

Front door access terraced housing – can be 2 - 4 storey

On street parking for mews to rear

This type of low density housing, modelled on the type of housing found in the inner suburbs of Dublin and other cities, uses deep on street plots.

- **Density**: 25 dwellings per hectare
- **Covered area**: 44%
- **Plot ratio**: 0.72 (2-3 storeys)
- **Gross area per unit**: 115-160m²
Breaking up the scale of row housing and making it more aesthetically interesting with different facade materials expressing the residences behind.
Row housing in Accordia, Cambridge, the terrace is at first floor level and the tree in the background is located in the lower level external space.
B | TERRACED COURTYARD HOUSES

Patio housing with private courtyard at ground floor to allow for light

This low density courtyard housing uses less land than terraced housing and provides private courtyard spaces.

+ **Density**: 35 dwellings per hectare
+ **Covered area**: 80%
+ **Plot ratio**: 0.73
+ **Gross area per unit**: 250m²

Car parking in front gardens

250m² dwelling

Higher volumes in the centre that stagger to give views and light

Living room

Private courtyard

Parking
8 Villas, Amsterdam, Netherlands by Bosh Architects.

G | SMALL BLOCK

Images: Residential Building Achslengut by Baumschlager Eberle in St. Gallen - CH. Source: baumschlager-eberle.com
Typical inner city block with strong street elevation. Ground floor can be commercial or residential but the success relies on well designed buffer gardens.

- **Density**: 260 dwellings per hectare
- **Covered area**: 46%
- **Plot ratio (6 storeys)**: 2.1
- **3 Core**
- **9 Apartments per floor**
- **Gross area per floor**: 900m²
- **12m² private terrace**
- **1650m² communal garden**

Parking depends on location – can be underground or on street.

Private front garden acts as a buffer space to path.
+ **Density:** 250 dwellings per hectare
+ **Covered area:** 70%
+ **Plot ratio (6 storeys):** 3.9
+ **4 Cores**
+ **50 Apartments/Duplexes per two floors.**
+ **Gross area per floor:** 2635m²
+ **12m² private terrace**
+ **585m² communal garden**

In this high density courtyard block north/south apartments are a split duplex apartment with south facing living spaces (see Type 2.5).
J | MIXED USE BLOCKS

Efficient planning with 5/8 units off a core

+ **Density:** 260 dwellings per hectare
+ **Covered area:** 46%
+ **Plot ratio (6 storeys):** 2.1
+ **3 Core**
+ **15 Apartments per floor**
+ **Gross area per floor:** 900m²
+ **12m² private terrace**
+ **1650m² communal garden**

Ability to provide variety in the urban streetscape and create intimate on street gardens leading to a successful public realm.
1.1 DENSITY | HIGH DENSITY

J | MIXED USE BLOCKS

Images: Apartment Block by X-TU in Nanterre, France. Photographs: Luc Boegly Source: archdaily.com
This scheme uses a checkerboard layout to create internal atrium gardens - this is suitable for inner city sites and creates usable friendly areas for children to play safely particularly in winter.
1.1 DENSITY | HIGH DENSITY

**Density:** 330 dwellings per hectare

**Covered area:** 25%

**Plot ratio (5-9 storeys):** 3.3

**1 Core**

**4 apartments per floor**

**Gross area per floor:** 400m²

**10m² private terrace**

**970m² communal garden**

---

This is for dense city centre locations and creates all apartments which are dual aspect.

Height in a city can act as a point of reference in the urban landscape.

---

Topmost floor greater or equal to 20m then core must be treated as a fire fighting shaft.

1.2 APPROACH AND CORE DESIGN

OWN DOOR ACCESS

A | DIRECT FROM STREET   B | HALF LEVEL   C | MULTIPLE LEVELS

D | DIRECT FROM COURTYARD   E | DIRECT FROM WINTERGARDEN
COMMON ACCESS + INTERNAL DISTRIBUTION

F | STANDARD CORE

G | EXTERNAL STAIRCASE

H | GALLERY ACCESS

I | ATRIUM ACCESS
1.2 APPROACH DESIGN AND CORE DESIGN

Own door access apartments are highly sought after if designed correctly particularly for families and the elderly. Passive high quality buffer gardens to shield living spaces from overlooking is critical in the design.

Accordia, Cambridge, UK by Maccreanor Lavington Architects. Passive buffer gardens and balconies are combined with high quality planting to make a friendly edge and block passersby from viewing in. Landscaping has matured since this photo taken at handover.
Half level apartments can form a dual function, it allows one to give more privacy to the ground floor units but if done cleverly can act as a fresh air strategy for car parks or basement areas screened with planting. However, access for people with disabilities should be considered.

Source: www.rkvisual.ca
The 8 house by BIG Architects below is a very unique design in Copenhagen, Denmark where there is a ramped access to units in a promenade as high as the 12th floor. It shows the possibility to have own door access over multiple levels in an innovative way using a mix of typologies.

Source: flickr.com
Image: 8 House by BIG Architects in Copenhagen, Denmark
Source: designboom.com
Courtyard access in inner city developments or off busy trafficked roads, tends to lower the noise and make a nicer atmosphere for the development. The below project by Renzo Piano Architects in Paris uses Birch trees to create a dappled light and stop overlooking from apartment to apartment. All units are entered from the courtyard off dedicated cores and ground floor apartments are protected by buffer planting. As the image below demonstrates, use of dense planting in urban locations can be very effective.
Peabody, St. John’s Hill by Hawkins Brown in London, UK

1.2 APPROACH DESIGN AND CORE DESIGN

This configuration shown in the diagram above departs from standard code performance and requires a customised fire safety design.

Howth Road by OMP Architects which is a built example of wintergarden design in Ireland

Source: OMP Architects
Most schemes in large developments are corridor access. Wherever possible natural light will make the experience more interesting. The design of the corridor using high quality lighting and picking out entrances in an interesting way as shown below is important.
This project by Plot Architects in Copenhagen uses natural light and colour to make the corridors an interesting experience.

Internal Cores can be designed well if the corridors are designed properly and natural light where possible is integrated.

Interior cores on the facade can bring a great quality to the experience of the user.
This scheme in Paris uses an external staircase which is covered and makes the space into a larger space for children. This is an innovative use of space and works well in tough inner city sites like this one in Paris.

Logements de la Poste by Philippe Gazeau in Paris, France – External staircase acts as a shared space

Source: cgociety.com / tankonyv.tar.com
View of terraced gardens off staircase.

Fire Safety consideration in Ireland may impose limitation on building height.

External cores can be a very good design feature.

1.2 APPROACH DESIGN AND CORE DESIGN

Gallery Access is a very cost efficient way to design apartments. If designed properly it can be a very attractive form of development and can encourage community activity.

80 Dwellings by Toni Girones in Salou, Spain. Photograph: José Hevia

Sources: archdaily.com
The key is to have offset gallery access from the units as shown in the project with mini bridges reaching over to the doorways of each unit. Typically kitchens and bedrooms are located on the gallery facade.

Shielding and screening of fire escape routes needs consideration.
Atrium Access housing can be a very clever way of creating all weather internal social spaces as well as forming a space for people to meet which is exciting spatially. The development below in Copenhagen is the renovation of a former Silo building by MVRDV Architects with an internal atrium as the main circulation and only one lift core.
The development is for an apartment building in Sweden by Tham Videgard Architects with five units and one stairs and one lift. This acts as the fire stairs for the building over 6 storeys.
Good lobby design is critical in any scheme. The approach to this apartment block above in Copenhagen is well designed which uses good quality lighting and a bright art piece to create a safe and protected entrance.
Concierge and lobby spaces are becoming more and more important in apartment buildings. The concierge can act as building manager and providing passive security and as well as helping tenants with day to day issues like post and deliveries and creates a social space for people to meet.
This block of apartments in Rue De Suisse in Paris by Herzog and De Meuron uses a covered space which is exterior to create a welcome zone and post box area. The projects to the right show how innovative lobby and post box design can bring a value to a development.
QUALITY APARTMENTS & URBAN HOUSING

This is a non-exclusive range of block layouts that can be applied to large sites depending on the site size and layout.

1.3 Block Layout | Index

A | Corridor Access East-West

B | Duplexes

C | Core Access

D | Gallery Access
1.3 BLOCK LAYOUT

A | CORRIDOR ACCESS EAST / WEST

- 7 units per core per floor
- 28.5% dual aspect to be combined with other blocks in bigger developments to achieve dual aspect minimum
- 47.9% wall to floor ratio
- 86.9% efficiency
- east west orientated blocks only
+ 6.5 units per core per floor
+ 84.6 dual aspect
+ 46.8% wall to floor ratio
+ 86.6% efficiency
1.3 BLOCK LAYOUT

C | CORE ACCESS NORTH/SOUTH OR EAST/WEST

- 3 units per core per floor
- 80% dual aspect
- 46% wall to floor ratio
- 88% efficiency

D | GALLERY ACCESS NORTH/SOUTH

- 7.5 units per core
- 86.6 dual aspect
- 49.9% wall to floor ratio
- 93% efficiency
**E | Corridor and Duplexes**

- 8 units per core per floor
- 62.5% dual aspect
- 46.1% wall to floor ratio
- 88.3% efficiency

**F | Corridor and Core Access**

- 5.33 units per core per floor
- 56.2% dual aspect
- 45.8% wall to floor ratio
- 86.4% efficiency

**G | Corridor and Gallery Access**

- 8 units per core per floor
- 62.5% dual aspect
- 48.1% wall to floor ratio
- 85% efficiency
This project in Gennevilliers in France by MFR Architects which is under construction has a very interesting plan where the Architects use both gallery and corridor access design. This is a cost effective model that provides residents with a variety of different views and experiences. The block above is 105 units with a commercial ground floor use.
This development of 80 dwellings in Salou, Spain by Toni Girones Architects uses gallery access in a very cleverly designed way. The entrance space is partially exterior, partially interior. There have also been clever examples of this in London and Vienna which have similar climates to Ireland.
ZAC Boucicaut by Michel Guthmann in Paris, France Photographs: Michel Denancé
Source: archdaily.com
This project by AHMM in Adelaide Wharf in London by Alford Hall Monaghan Morris Architects, uses a very efficient plan, meaning that money is available to spend on the facade and public spaces. It is a social housing scheme. Long corridors are used with only 2 main cores. Glazing at the end of each corridor provide natural light and views. In places the length of the corridors may be excessive however the principles can be translated to smaller sites.
13 dwellings in a mixture of duplex houses on the ground and first floors and two bedroom apartments above. Vaudeville Court in Islington, UK, by Levitt Bernstein.
Access to apartments above on-ground floor with on-street access.

Image: Vaudeville Court by Levitt Bernstein in Islington, UK
Source: levittbernstein.co.uk

Vaudeville Court, Islington, UK, by Levitt Bernstein in London has an innovative hybrid mix of own door access and gallery rear access on an infill site.
This chapter considers a range of apartment typologies. Areas shown are generally in compliance with the DHPLG Design Standards for New Apartments (March 2018).

2.1 STANDARD STUDIO

THE ABOVE DESIGN IS FOR A STUDIO APARTMENT WITHOUT AN INTERNAL LOBBY. THE DESIGN WOULD REQUIRE A FIRE DESIGN SOLUTION OTHER THAN STANDARD BUILDING REGULATION COMPLIANCE UNLESS AT GROUND OR FIRST FLOOR. IN ADDITION, OMITTING LOBBIES MAY NOT BE APPROPRIATE IN ALL INSTANCES – MAINTENANCE AND OTHER ISSUES REQUIRE CAREFUL CONSIDERATION.
Image showing open plan apartment with glazed screen separating living area from the bedroom. The layout of the studio allows for screening between the bedroom and the living area, providing privacy and flexibility.

</table>

**Total** 94.1m² (90.0m²) Minimum

The design would require a fire design solution other than standard Building Regulation compliance unless at ground or first floor level.

In addition, omitting lobbies may not be appropriate in all instances – maintenance and other issues require careful consideration.

*Areas shown are generally in compliance with the DHPLG Design Standards for New Apartments (March 2018), taking into account the fact that: “The majority of all apartments in any proposed scheme of 10 or more apartments shall exceed the minimum floor area standard for any combination of the relevant 1, 2 or 3 bedroom unit types, by a minimum of 10% (any studio apartments must be included in the total, but are not calculable as units that exceed the minimum by at least 10%).

Kitchen may be required to be enclosed.
The above design is for a standard non fire engineered two+ or 3 bed apartment with internal lobby.

Colourful boxes on balconies act as storage spaces.

Good quality balcony areas can be like a second living room in apartments. Balconies screened or enclosed as storage spaces for buggies, prams and other items that don’t need protected storage, can be provided.

This chapter deals with the design of auxiliary spaces and common amenity spaces such as concierges, common rooms and tenant public areas. This is very common in build to rent but is becoming more common in apartments for sale.
A good place to live has a:

- Sense of community
- Sense of neighbourhood
- Is safe
- Generous private open spaces

Shared well supervised open spaces
SENSE OF COMMUNITY

CHILDREN FRIENDLY

ELDERLY FRIENDLY

WALKING DISTANCE 5 min

CLOSE TO LARGER LANDSCAPE

NEIGHBOURHOOD
04 • SHARED SPACES

NEIGHBOURHOOD

Space provided to meet neighbours

GENEROUS PRIVATE OPEN SPACE

Open space for private play and gardening
4.1 CONCIERGE AND ENTRANCE AREAS

Image: Arcus Center by Studio Gang in Michigan, US. Photograph: Iwan Baan. Source: designboom.com
Good quality shared spaces such as living rooms, relaxation areas, reading zones and skype and laptop zones are important for any development.
4.2 COMMUNAL OPEN SPACE / PLAYGROUNDS

4.4 BIKE PARKING AND CAR PARK ENTRANCE DESIGN

Image: FixStation by Urban Velo. Source: wired.com
Good quality parking spaces for bicycles are essential, particularly where there is lower car ownership. More and more apartment buildings are adding bike facilities to replace cars including bike rooms to fix your bike with free tools and vending machines for spare parts and nutrition bars for exercise.

QUALITY APARTMENTS & URBAN HOUSING

05 PLACE MAKING AND STREETSCAPES
This project, by Ash Sakula Architects connects to the history of the city by reinventing the "Tyne-side flat", a Newcastle mid-nineteenth century typology. The scheme makes a cohesive community which takes cues from the traditional life of terraced streets. Every home has its own front door which opens directly onto a proper street. Buildings run up the slope from the riverside creating a series of splayed spaces widening to the river with different degrees of private and public spaces. The architects used the section to create different environments, sometimes providing slightly raised garden areas which are more private and sloping streets which allow the public or the residents access to the canal. Overall this gives the scheme great diversity. Low divisions of the front gardens encourage neighborly relations and make the alleys a place of exchange.
The master plan by Feilden Clegg Bradley Studios is about the relationship between private and public spaces. It offers a new model of outside-inside living. Instead of traditional gardens, the architects' designed terraces, courtyards, interior rooftops and balconies create a different type of privacy. These spaces are completed with large communal gardens encouraging neighbours and children’s activities in a safe place. Ground surfaces enhance pedestrians and cycles routes to create a healthier and quieter place to live in.
Adamstown, by OMP Architects, is a key development on land located 16 km west of Dublin. Objectives are to develop a higher density district around a train station and reduce utilization of cars by promoting cycling and walking. A good variety of parks and places gives a strong identity to each neighborhood as well as gathering spaces for residents.

Source: OMP Architects
Boulogne-Billancourt is a mix-used district in Paris based on a network of generous planted public spaces. Paris is traditionally made of closed lots and provide very few public parks due to its density. Boulogne-Billancourt opens out the internal landscaped spaces, letting nature spread around the district. The project is a network of planted public spaces connecting three large green areas: the Billancourt’s park, the Ile Seguin’s garden and the river quays. Clever ground treatments offer multipurpose public surfaces.

Inside lots are public or semi-public, generously planted, creating car-free and safe paths in the city. It contributes to the high environmental quality of the district by reducing pollution.
